1. Get started quickly

To start the game, open the demo scene found under “Demo/Scenes/Demo Scene”.

Here you can find a canvas with the UI of the game. The UI includes a picture and frame, the letter board, buttons to pause/restart the game, and a timer. To start the game you can simply press play. If you want to edit or create new game settings to customize your game you can create personalized scriptable objects and add them to the **GameUI** component in the **GameUI** object in the hierarchy.

2. Introduction

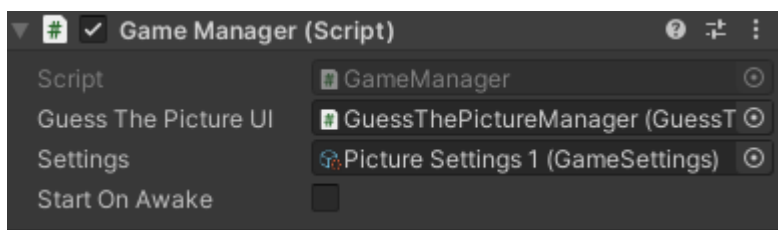

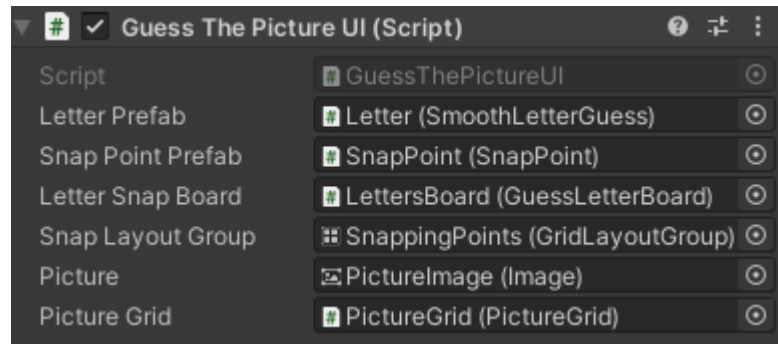

DTT Guess The Picture is a Unity asset that allows you to easily implement a game to guess the word from the hidden picture. The asset allows you to customize the playing field and difficulty of the game. To create levels you can use scriptable objects that allow you to choose your own images, words, and optional letters. These can be modified to increase the difficulty and set a harder challenge for the player. All this allows for an easy and fast way to implement a simple picture guessing game into your project.

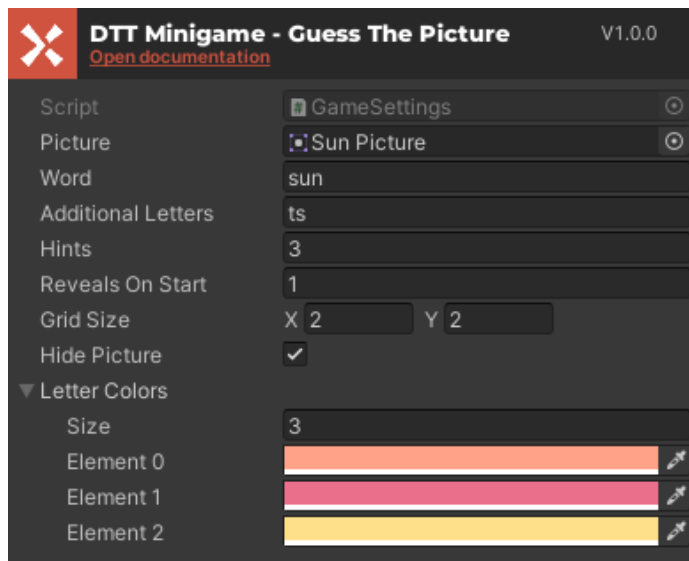

3. Set-Up

To set up your own picture guessing game you can check the structure of the demo scene and also follow these instructions:

- Start by adding the **GuessThePictureInterface** component onto an object in the scene and creating the required objects.
- Create a prefab of a Letter and SnapPoint by adding the **SmoothLetterGuess** and **SnapPoint** component respectively.
- Create a **canvas** in your scene. Inside it create a game object and add the **GuessLetterBoard** and **GridLayoutGroup** components. Letters will be placed as children of this object.
- Next, create another game object with a **GridLayoutGroup** component inside the canvas for where the empty word should be placed, here is where the player will drag the letters from their guess.
- For the **picture** Add a game object with an **Image** component to showcase your secret image.
- The **FlexibleGridLayout** and **PictureGrid** components should be placed on a game object on top of the picture to create the grid of squares that will hide it.
- Add the **GameManager** component onto an object in the scene and set the reference to the **GuessThePictureInterface**.
- You can create your own game settings by right-clicking on your project and going to Create -> DTT -> Minigame -> Guess The Picture -> **Game Settings**.

4. Editor

The **Game Settings** inspector window allows you to personalize the settings for a level of your minigame and adjust the difficulty.

1. **Picture:** The picture used in the minigame. This can be hidden by the picture grid.
2. **Word:** The secret word that is represented by the picture.
3. **Additional Letters:** Optional letters that can be added to confuse the player when guessing the word.
4. **Hints:** The number of hints the player can use to reveal a square of the grid.
5. **Reveals On Start:** The number of squares revealed at the start of the game.
6. **Grid Size:** The size of the grid that covers the picture.
7. **Hide Picture:** Whether the picture should be hidden or not.
8. **Letter Colors:** The possible colors used in the letters.

5. API

GameManager

Main class that handles starting, pausing, ending and restarting of the game.

Property Name	Type	Description
Started	Action	Event that is called when the game has started.
Paused	Action	Event that is called when the game has been paused
Finish	Action<GameResults>	Event that is called when the game has finished. It passes a reference to a Game result class with the results of the minigame.

Method name	Return Type	Parameters	Description
StartGame	void	GameSettings	Starts the minigame.
Pause	void		Pauses the minigame.
Continue	void		Continues the minigame.
Restart	void		Restarts the minigame.
ForceFinish	void		Finishes the minigame.

6. Known Limitations

- **PictureGrid:** The **PictureGrid** component does not use the child alignment values.

7. Support and feedback

If you have any questions regarding the use of this asset, we are happy to help you out.

Always feel free to contact us at:

unity-support@d-tt.nl

(We typically respond within 1-2 business days)

We are actively developing this asset, with many future updates and extensions already planned. We are eager to include feedback from our users in future updates, be they 'quality of life' improvements, new features, bug fixes or anything else that can help you improve your experience with this asset. You can reach us at the email above.

Reviews and ratings are very much appreciated as they help us raise awareness and to improve our assets.

DTT stands for Doing Things Together

DTT is an app, web and game development agency based in the centre of Amsterdam. Established in 2010, DTT has over a decade of experience in mobile, game, and web based technology.

Our game department primarily works in Unity where we put significant emphasis on the development of internal packages, allowing us to efficiently reuse code between projects. To support the Unity community, we are publishing a selection of our internal packages on the Asset Store, including this one.

More information about DTT (including our clients, projects and vacancies) can be found here:
